

During the day of the voting i noticed that most of the people that went to vote were old people or inexperienced people with technology that had trouble on the registration as out of all the people that went to my voting center aproximately 90% of them went to registrate, and the rest wanted to vote, although none of the ones that came to register put any negative claim about it.

The app worked well during the whole time the only problem was that when one ended the questionnaire and hit end you could press the back button and get back and change the options of the person before, but this was not a problem to any of the users, but there were more problems on the interaction as one of the more common ones was that the citizens didn't knew the code of the projects so i think it was a bad decision to make the only way to know the project be something hard to remember like a code and not the name of the project but more than that most didn't need any kinda of further guidance other than for us to explain what they had to do, one thing that i did notice that was solved by the explanation but could have been more intuitive to the ones not so used to technology was to make the options that "look incomplete" as some of the older individuals didn't notice that there were more options so they didn't instinctibly scrolled down, so seeing an option with incomplete information would tell them that there were more options
